Please amend the Abstract as follows:

(57) ABSTRACT

A method for changing the distribution of the loading pressure prevailing in the press nip

of a shoe press, which shoe press-comprises includes a number of adjacent loading elements (K)

acting on the press shoe (70), the first end of said the elements being supported on the

supporting beam (12) of the shoe press and the other end on the press shoe (70). The loading

elements (K) are moved in the machine direction (MD) in the space between the press shoe (70)

and the supporting beam (12) by acting on the loading element (K) at least at the end adjacent to

the press shoe in such manner that the end adjacent to the press shoe is moved in the machine

direction (MD) in relation to the press shoe (70), and that the end of the loading element adjacent

to the supporting beam (12) can be caused to freely assume a position in relation to the

supporting beam (12), preferably at least during the transfer.
